

Power BI AutoML for Dataflows

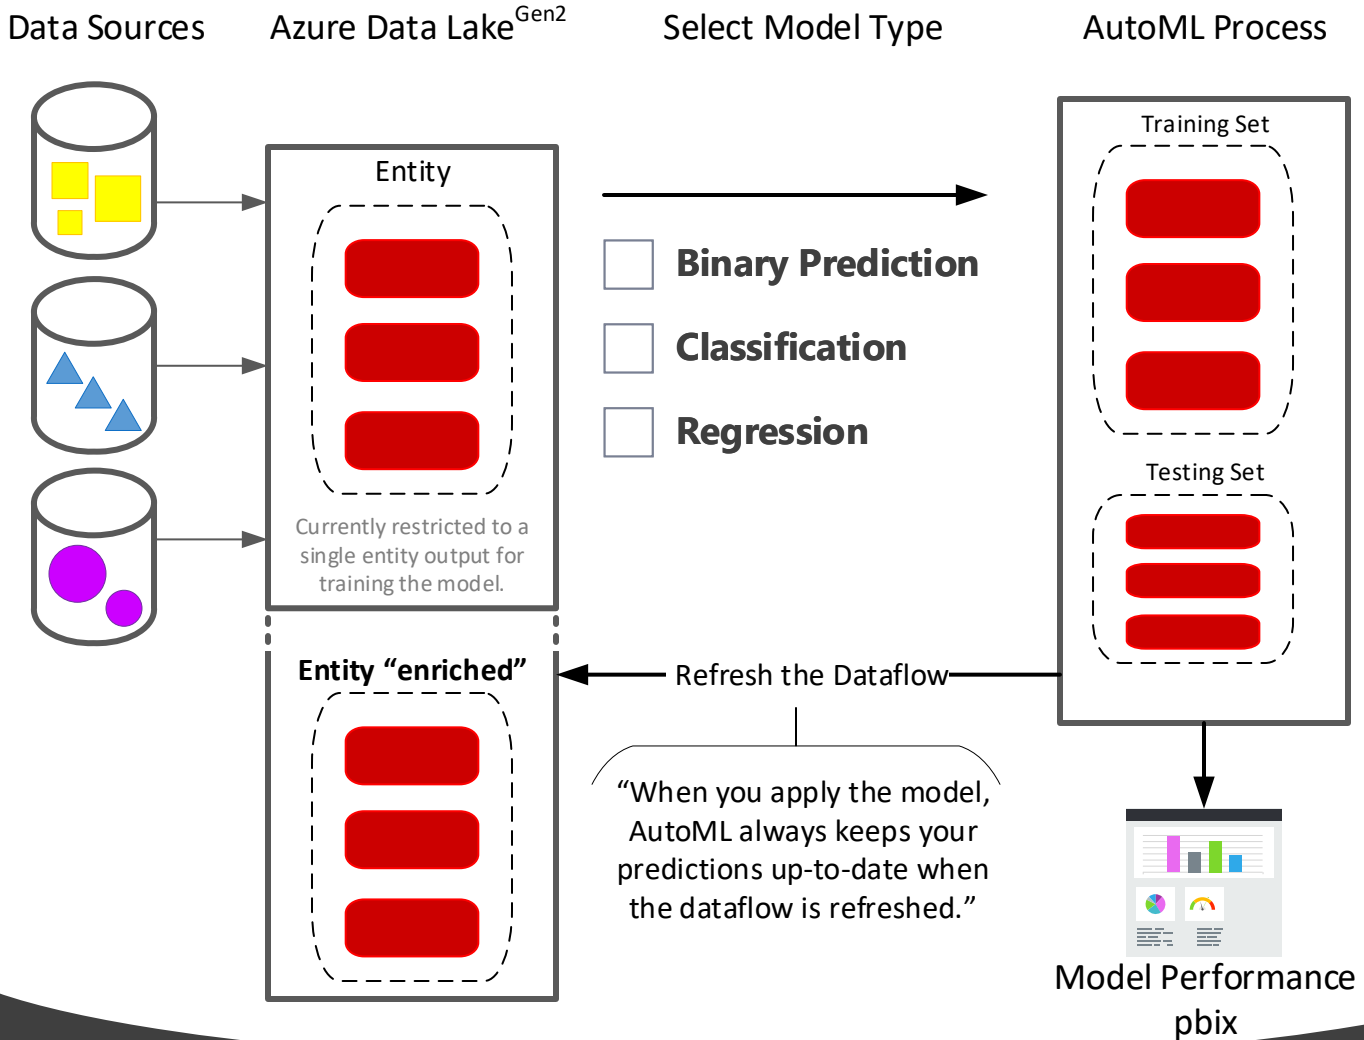

Quick Guide

2019-08-06: Currently available for Dataflows on Power BI Premium and Embedded capacities.

Train and host your automated machine learning (AutoML) within the Power BI Service.

PBI Service will leverage the Azure Machine Learning Service for the AutoML Process within Dataflows

<https://docs.microsoft.com/en-us/power-bi/service-machine-learning-automated>

Automated machine learning (AutoML) allows power users like business analysts to develop machine learning models directly within Power BI Service.

Binary Prediction Models will classify a dataset into 2 groups, and are used to predict a binary outcome of an event like will an invoice be paid on time. Classification Models will classify a dataset into multiple group, and are used to predict multiple outcomes like high, moderate, low, etc risk. Regression models are useful for predicting a value such as the day an invoice will be paid on.
